Strengthening Our Local Economy and Protecting Essential County Services

Measure E would update and extend the business license tax on commercial wind farms to keep pace with inflation. This is an important update because the existing tax rate has not been adjusted since **1994**.

The measure would also extend the business license tax to other energy generation, extraction, and storage facilities, including **solar farms, natural gas wells, battery storage facilities, and data centers**. While there are currently no data centers proposed in the unincorporated areas of Solano County, this measure ensures that if these large-scale facilities are developed in the future, they will contribute their fair share toward the County services and infrastructure they rely upon.

Measure E is estimated to generate approximately **$353,000 annually**, not including potential revenue from data centers, since none currently exists in the unincorporated county.

This measure helps **strengthen our local economy, protect essential County services, maintain critical infrastructure, and ensure that visitors and large corporations contribute their fair share** toward the public services and resources they use.

Most importantly, these revenues will stay local, helping support our community rather than being sent away to the State and Federal governments.
